Tone mapping options (VF1), build 1788

What it changes: how the brightest parts (spot-lit sand, white rock, the lit room wall)
roll off instead of clipping to flat white. Mid-tones keep the same brightness in all three.

A. UNCHANGED highlights clip to flat white (reef sand glows pale blue); bright lime greens;
warm glow on the wall.
B. AgX soft roll-off, but whites dim toward grey, greens go olive, darks lift: flatter.
C. ACES firm roll-off, whites stay bright, greens stay rich, deeper blacks.

Cost: AgX +0.1 to +0.3 ms GPU per frame, ACES +0.1 to +0.2 ms; no extra draw calls,
no extra shader compiles.

Recommendation: C. ACES. Fixes the blown-out reef sand without dulling the plants.
The later plant colour retune moves lime greens toward real aquarium greens anyway.

Pages 2-10: 3 tanks x 3 views; A | B | C side by side, same camera, same scene.

Planted 48 in (79 gal) - Front view

A. UNCHANGED (today)

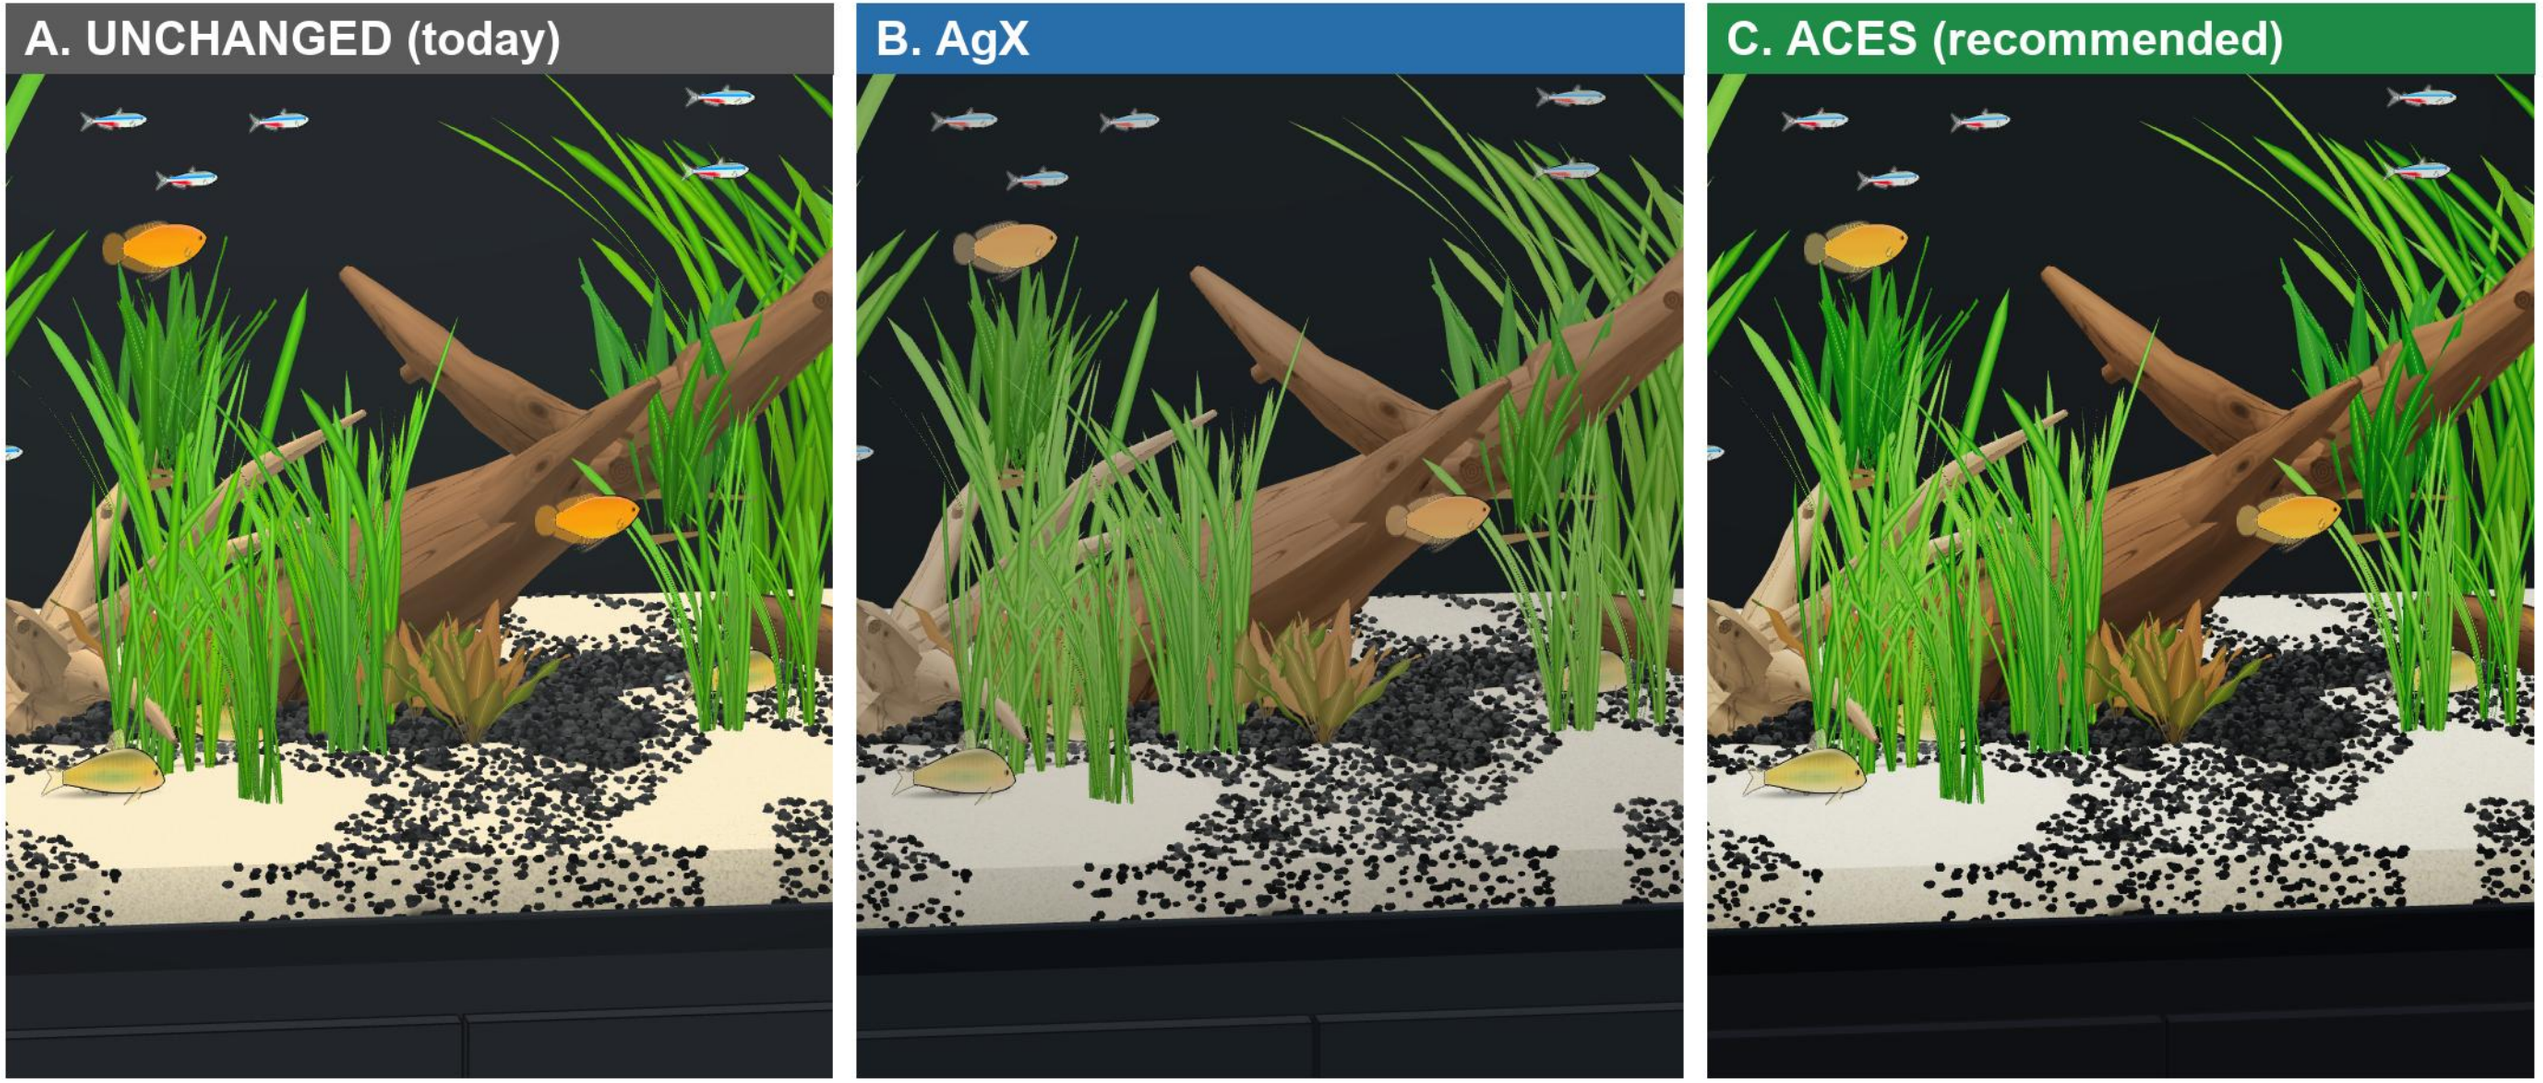

B. AgX

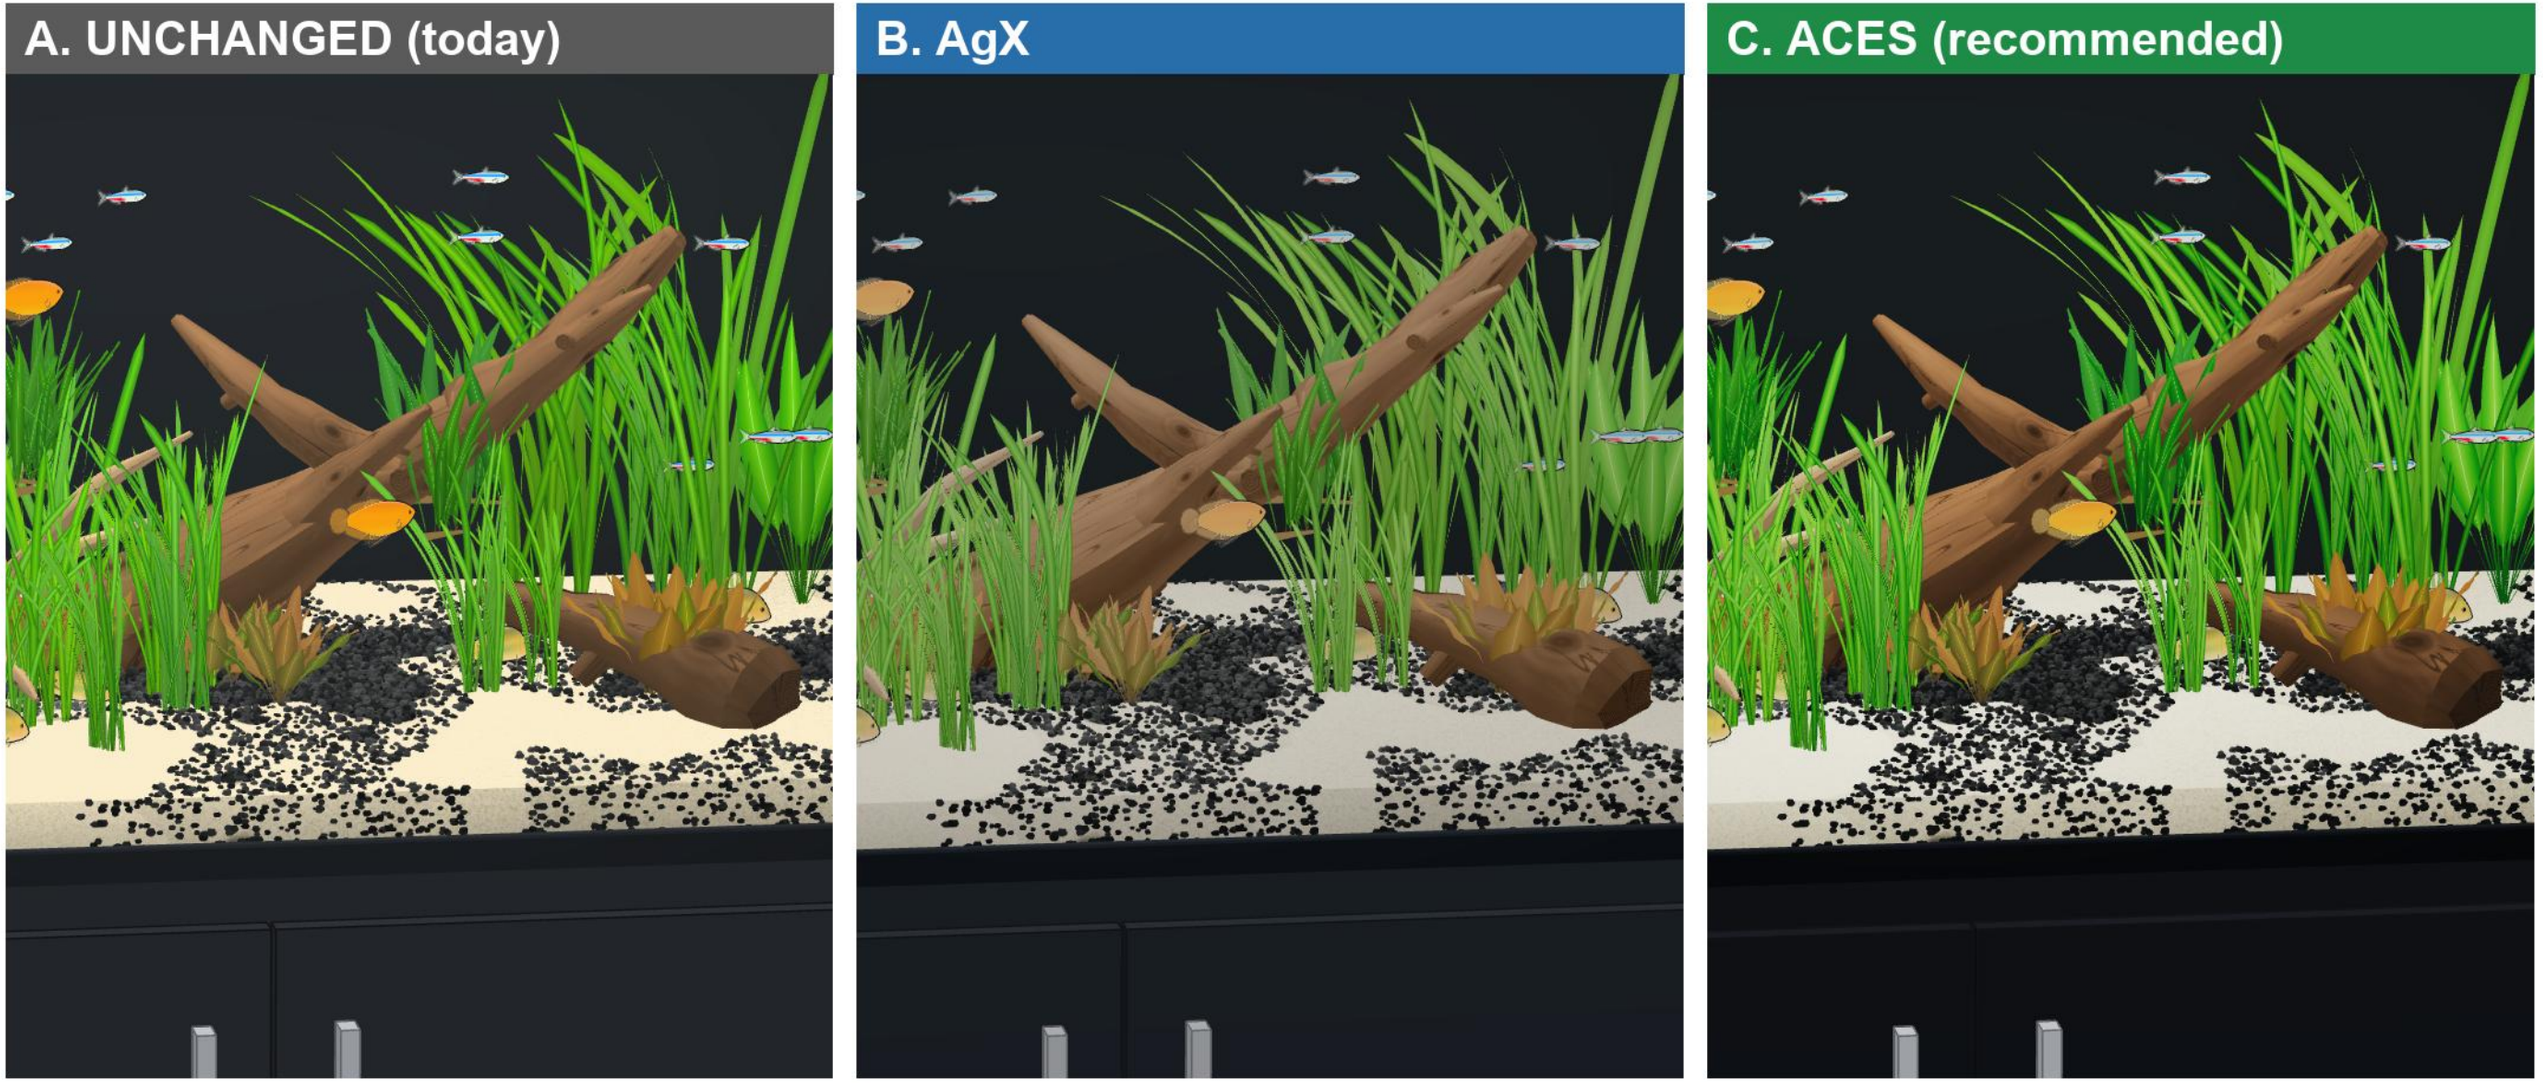

C. ACES (recommended)

Planted 48 in (79 gal) - Substrate close-up

Planted 48 in (79 gal) - Rock / wood close-up

Rimless nano (10.7 gal) - Front view

A. UNCHANGED (today)

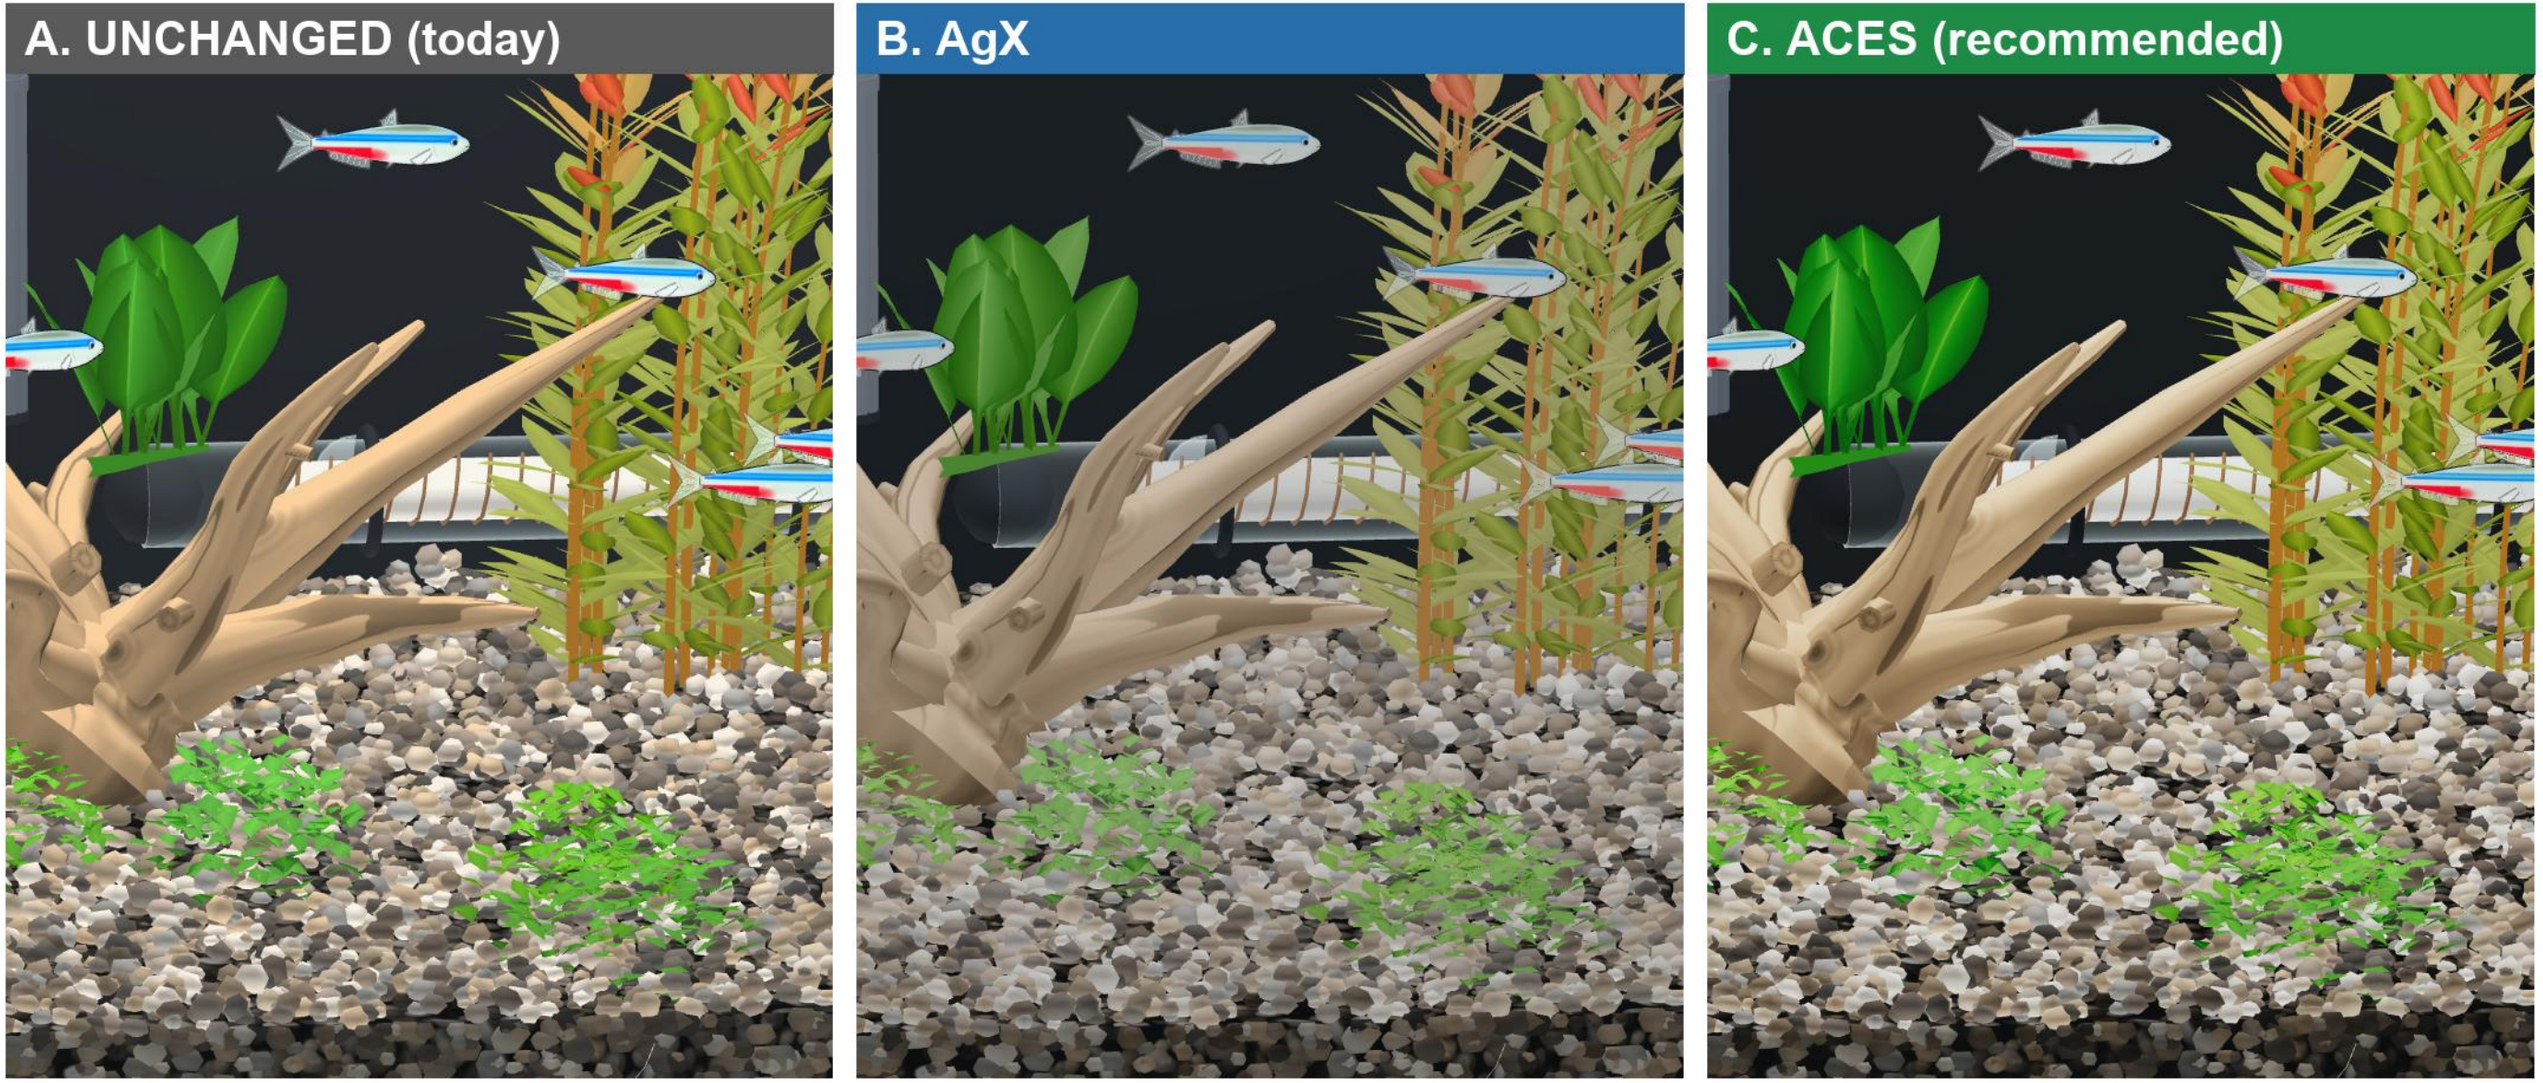

B. AgX

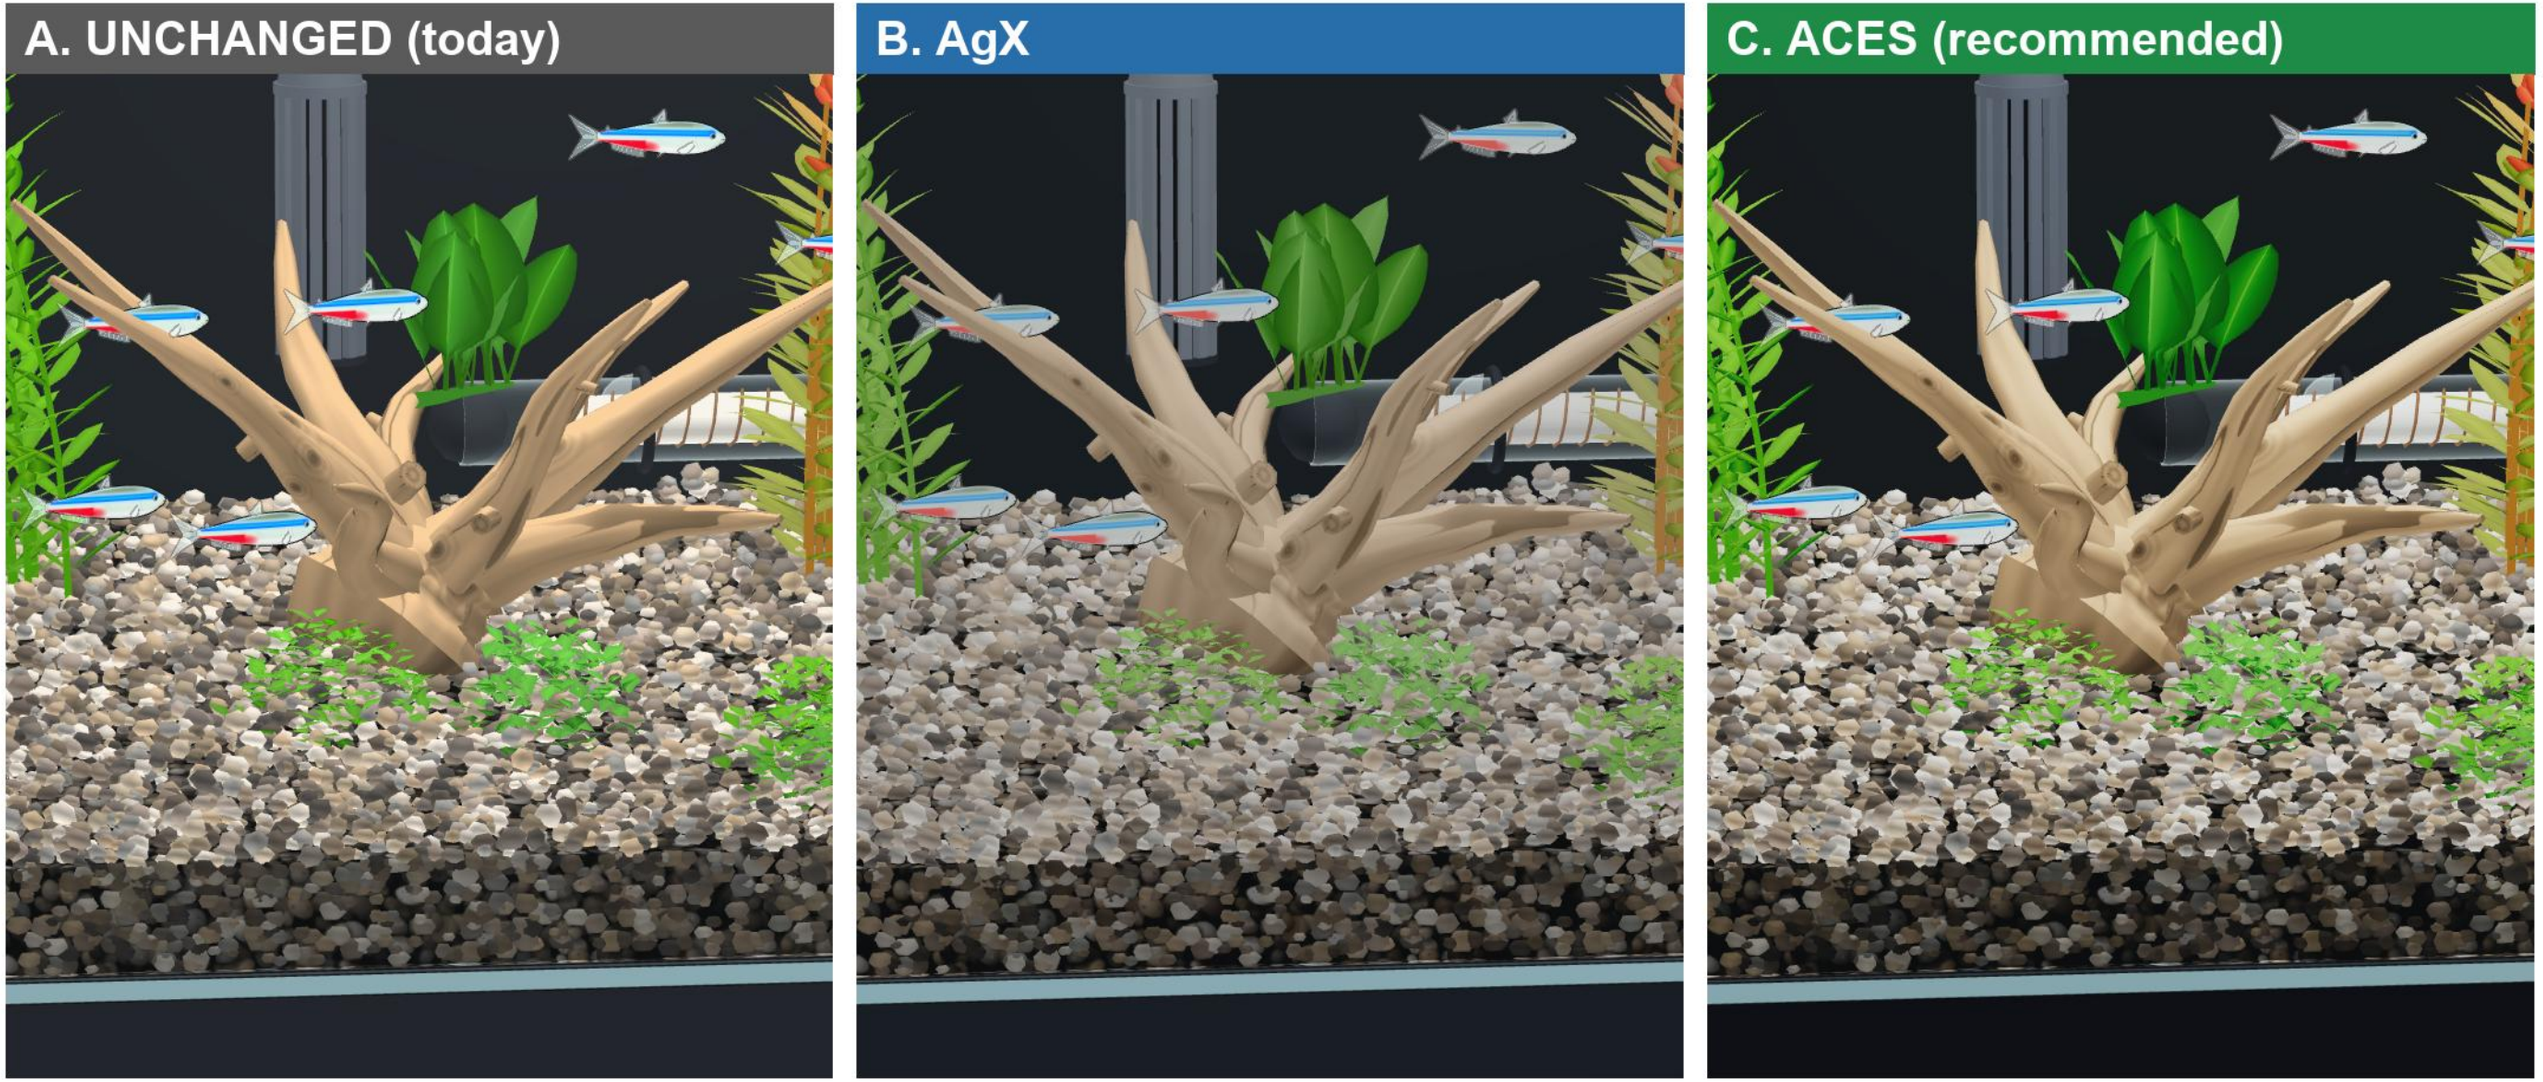

C. ACES (recommended)

Rimless nano (10.7 gal) - Substrate close-up

Rimless nano (10.7 gal) - Rock / wood close-up

Reef 48 in bow-front - Front view

A. UNCHANGED (today)

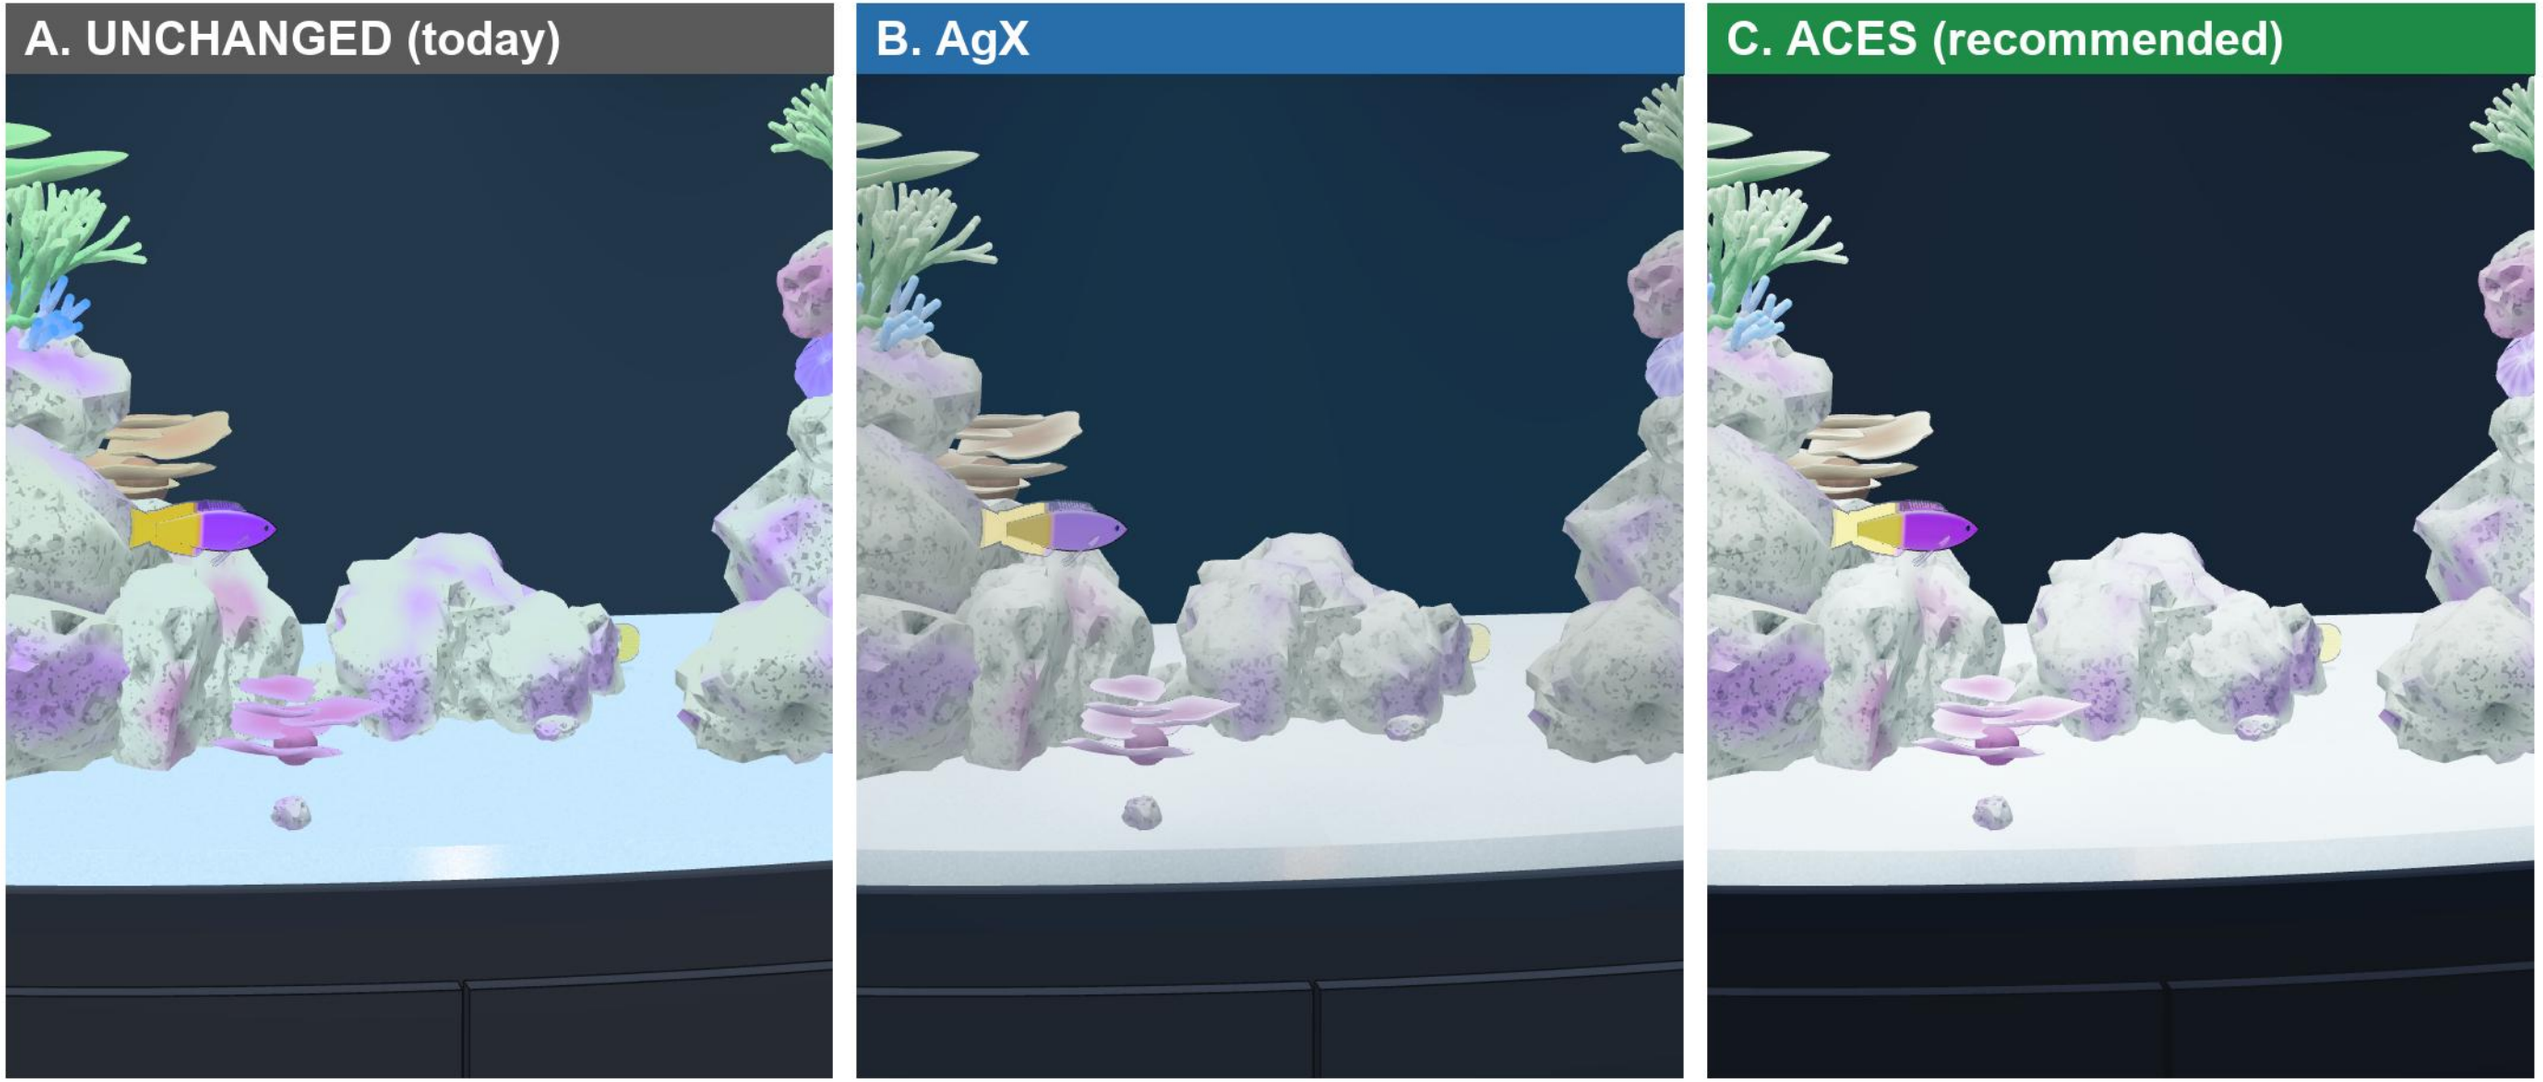

B. AgX

C. ACES (recommended)

Reef 48 in bow-front - Substrate close-up

Reef 48 in bow-front - Rock / wood close-up
